

3.DESIGN:

The design phase focused on constructing a scalable technical architecture for the Smart Laptop Request Management system. The layout was engineered to establish clean, distinct transactional patterns between employees, managers, and the IT fulfillment support team. By using native ServiceNow schema frameworks, the application provides high performance and a clean data model that avoids the complexities of over-customized table extensions.

The User Interface Layer (Service Catalog Configuration):

The user experience begins with a dedicated Service Catalog item formally named "Request a Laptop for Work Purposes". This component is published within the IT Hardware catalog category on the Service Portal. To collect precise user attributes while maintaining a clean layout, specific variables were mapped onto the form canvas. Dropdown choice structures and reference fields were utilized to standardize data capture, ensuring information remains consistent before hitting database tables.

Variable System Name	Data Type Type	Functional Purpose & Validation Enforced
employee_name	Reference (sys_user)	Auto-populates with logged-in user profile data; read-only.
employee_id	Single Line Text	Mandatory numeric identifier matching corporate HR master logs.
laptop_type	Select Box (Choice)	Predefined options: Standard Developer, Light Travel, Creative Workstation.
department_ref	Reference (cmn_department)	Binds request directly to cost-center tracking paths.
business_justification	Multi-Line Text	Mandatory text input requiring details regarding business need.
