

4.PLANNING

Effective project planning and resource scheduling played a crucial role in delivering the Smart Laptop Request Management application within scope and on schedule. The team adopted an iterative, phased delivery approach to ensure that requirements were systematically validated, built, tested, and documented. This organized progression minimized development re-work and kept all engineering activities aligned with the project's functional goals.

A core focus of the planning phase involved identifying and analyzing technical risks that could impact the system's launch or user adoption. Key concerns included manager approval bottlenecks, incorrect or incomplete user input data, and potential execution failures within automated workflows under high transaction loads. To address these vulnerabilities early, proactive mitigation strategies were built directly into the system's functional specifications rather than added as post-production fixes.

To prevent approval bottlenecks from stalling requests indefinitely, automated reminders and escalations were integrated into the workflow design. If a manager does not take action on a pending request within a specified timeframe, the system sends an automated follow-up notification. To eliminate bad or incomplete data at the source, strict data validations were implemented across the catalog form, making critical fields mandatory and formatting inputs properly before form submission is permitted.

Risk Assessment & Proactive Resolution Registry:

Risk 1: Approval Bottlenecks.

Impact: Requests stall out in queues indefinitely, causing hardware delivery delays.

Mitigation: Configured Flow Designer to evaluate approval durations and send automated manager alerts.

Risk 2: Incomplete Form Data.

Impact: IT technicians receive tasks missing critical specifications, requiring manual follow-up.

Mitigation: Implemented mandatory fields and input validations to prevent submittal of incomplete forms.

Risk 3: Workflow Logic Failures.

Impact: System errors prevent tasks from generating or notifications from sending.

Mitigation: Executed comprehensive, multi-scenario boundary testing during Week 5 to validate all logic paths.

This structured planning and risk mitigation framework provided the development team with a clear roadmap. By addressing technical challenges beforehand, the team ensured a stable implementation that met all stakeholder expectations and performance requirements.
